

VIZOR FOR SCCM

- IT & Software Asset management extensions for Microsoft SCCM
- No requirement for additional client side deployment
- Transform raw inventory data into actionable management reports
- Powerful automation capabilities

Turbocharge your Microsoft System Center infrastructure

Vizor leverages and complements your existing Microsoft System Center infrastructure to reduce IT costs by optimizing the administration of IT assets. Vizor's powerful web based interface frees data previously siloed in SCCM so all required organization parties can participate in the complete IT asset life cycle from employee request, through approval, procurement and provisioning. Vizor's software inventory normalization functionality transforms raw inventory data collected by SCCM into usable information for license and software asset management. Normalized data is then reconciled against entitlements to form your effective license position supporting complex licencing compliance schemes such as per CPU and per core. Turbocharge your Microsoft System Center infrastructure today with Vizor.

Multi-tenant web interface - Free your data

Vizor's powerful web based interface frees data siloed in SCCM so all stakeholders have visibility of IT Asset Management processes and procedures. Vizor's multi-tenant architecture ensures data is securely presented to appropriate users where required, for example giving department managers a view of assets only within their department.

Software inventory normalization

Vizor's elective software inventory normalization process transforms raw inventory data collected by SCCM into actionable information for license and software asset management. Normalization eliminates noise from inventory data such as patches and system updates gathered by SCCM. Vizor's normalization also permits version consolidation and facilitates grouping of identified applications into suites.

"The support from Vector was outstanding. Our end-users are delighted."

Turbocharge your Microsoft System Center infrastructure

Complex licensing compliance

Vizor supports complex compliance schemes such as per CPU and per core licensing models. Vizor can also be extended with custom license compliance calculations so your effective license position is always accurate, ensuring your organization's software remains legal and compliant.

Automate software delivery

Vizor leverages existing application deployment infrastructure in SCCM to automate software delivery. Vizor's unique role based provisioning functionality ensures necessary approval and then streamlines software delivery to users based on requirements of their role and projects. New employees are therefore productive from day one and should an employee leave, software is rolled back and licenses returned to the pool.

Asset and software request portal

Vizor's self-service asset and software request portal is an app-store for your organization, enabling end users to request exactly what software, assets and services they need, when they need it, thereby reducing waste of over provisioning. Requests pass through multi-layered approval processes, eliminating shadow IT and ensuring you remain compliant.

Complete asset lifecycle management

Vizor manages the entire asset lifecycle, from employee request, through approval, procurement, provisioning and eventual retirement. Vizor ensures managers are always up-to-date on the status of their assets, and therefore remain organized, compliant, and ready for any renewals, purchases, replacements or audits.

Manage cloud subscriptions

Vizor manages cloud service subscriptions for web apps like Salesforce and cloud computing platforms such as Amazon AWS and Microsoft Azure. Subscriptions can easily be allocated to end users, departments or locations. Vizor keeps track of current and forecast expenditure and notifies stakeholders regarding upcoming renewals.

Asset allocation

Knowing who has what provides department and asset managers with full asset visibility and allows for optimal IT asset management. Assets can easily be allocated to employees and locations. Vizor supports hierarchies including buildings, campuses, and even specific rooms or floors. Assets can also be checked in and out in the system so managers know where assets are located at all times.

Notifications and reminders

Vizor ensures managers stay on top of all IT processes such as asset warranty expiry and software maintenance renewals with timely email alerts and reminders.

How we're different

Unlike other solutions, Vizor actually reduces your workload by automating the most frequent IT requests, like user provisioning. Easily onboard assets for new employees, and recover them when they leave. Vizor will automatically coordinate the deployment of software applications, further reducing the workload for IT.

Vizor ensures you capitalize on existing investments in Microsoft System Center by utilizing capabilities in SCCM such as software delivery and network device discovery. Vizor enhances SCCM by managing underlying processes, ensuring you remain compliant and reducing costs by freeing demand on IT resources.
