# PC-Duo Web RAS Hosted: Connectivity Diagram
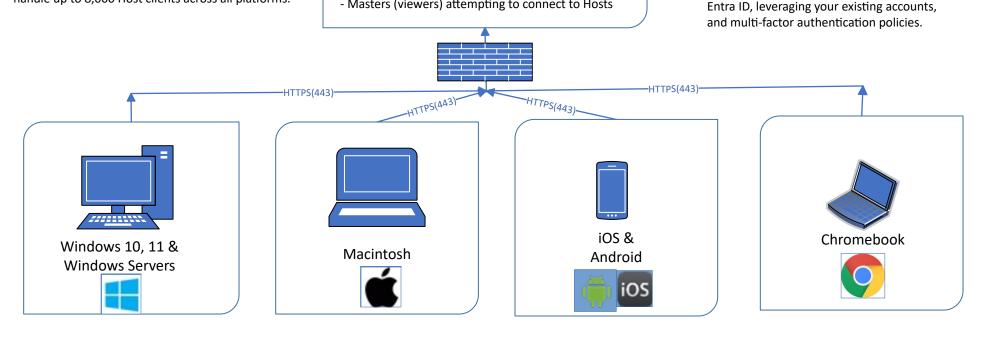

Diagram Notes:
As long as the device, client or viewer-side, has an internet connection and can reach the server on 443, PC-Duo Web handles the rest. Addresses are at the *.vizor.cloud domain.

PC-Duo Web employs reverse connection technology to allow remote desktop connections to devices behind firewalls. No inbound firewall rules or adjustments are necessary.

Any given PC-Duo Web server can comfortably handle up to 8,000 Host clients across all platforms.

The PC-Duo Web server listens inbound on 443 for:
- Web Console (management console) landing page
- Hosts (clients) reporting themselves in
- Masters (viewers) attempting to connect to Hosts

Entra ID Tenant (Customer Managed)

Entra ID Authentication
The PC-Duo Web server will delegate authentication to a customer's Microsoft Entra ID, leveraging your existing accounts, and multi-factor authentication policies.
